Develop a scenario: land improvement, improve livelihood of people

Economic cost-benefit analysis

Cost-benefit analysis is a tool derived from accounting that compares the costs of undertaking an action or a project (in this case, of adopting sustainable land management practices) against the benefits derived from it.

Describe two possible scenarios for your group's case study. How does your project affect stakeholders? What is the Timescale for your project?

Without project scenario (Current situation)	With project scenario (New scenario)
Current landuse:	New landuse:
